Lawa't Kape — Changes after the October 28 Evaluation

POS and captive-portal system · Capstone project · Updated October 30, 2026

Versions: 1.28.0.217 → 1.43.1.250 (34 releases) **Source:** both evaluation recordings, transcribed and reviewed point by point

Automated tests: 1,227 passing

22	21	12	6
evaluator requests reviewed	done and live; 1 kept by design	extra owner requests done	safety fixes found in code review

1. Evaluator requests — done

What the evaluators asked	What changed	Version
X-Read and Z-Read, standard POS functions Sir Manalo · R1 18:20, 52:09	**X-Read** button on the register: the shift's totals so far, printable, closes nothing. **Z-Read** on End of Day once every shift is closed: numbered Z #0001, #0002…, running grand total, first and last order, gross, Senior/PWD discounts, refunds, voids, cash and e-wallet. Non-VAT layout. After a Z-Read that day's orders can no longer be voided.	`1.33.0.236–237`
Sales report by day, week, month, year; best sellers Sir Manalo · R1 28:35	**Reports** → **Sales**: Daily / Weekly / Monthly / Yearly for any date; net sales with change vs previous period, orders, average, cash vs e-wallet, discounts, refunds, voids, chart and table, best sellers, slow movers, by category. Print or CSV.	`1.30.0.231`
Stock report; daily and weekly reports Ma'am Ella · R2 31:50	**Reports** → **Stock**: per ingredient start, received, used in sales, wasted, adjusted and end for the period; delivery and wastage cost; most used, most wasted, running low. Print or CSV.	`1.30.0.232`
Verify the opening cash; nobody verifies their own count Sir Manalo · R1 40:23 · R2 00:00	Start Shift shows the **last closing count** (who, when). A different count needs a reason and the owner is told. Closing no longer has "Use Expected Amount" — the drawer must be counted; shortages still email the owner.	`1.34.0.238`
Return / refund Sir Manalo · R1 27:33	**Refund items** on Orders: pick items and quantities with a reason. Owner refunds at once; staff refunds wait in the same approval queue as voids. Cash refunds come out of the open shift so the expected drawer stays right. Shown in reports and readings.	`1.35.0.239`
Receive deliveries by the PO reference; checklist of expected items R1 11:17, 34:10	Every sent order has a **PO number** (PO-00044, also in the supplier's email). Staff and owner **search the PO number or supplier** and get a checklist: change "Received" if less came, tick "Missing" if it didn't. Short items go to the owner with a note; missing items stay on order. Supplier's DR no. recorded.	`1.36.0.240, 1.39.0.243`
Record date received and expiry; first-in-first-out R1 10:07 · R2 29:15	Restock asks for the **expiration date**. **Expiring soon** on Ingredients (already expired / this week / this month) with the date received; stock is used oldest first. **Write off** logs expired stock as wastage.	`1.37.0.241`

What the evaluators asked	What changed	Version
Show the real internet speed; how much to give each guest R1 02:54	**Your internet line** on Wi-Fi Speed: measured download/upload (once a day after opening, ~13 MB for the prepaid plan, plus Test now), usage right now, recommended Mbps per guest after keeping some for the shop, guests per plan, and a warning when a plan is faster than the line.	`1.31.0.234`
One person runs the shift: POS and kitchen together R1 21:54	The Register shows **Menu | Orders to make | Current order** side by side with Start/Done. The separate Kitchen Display page was removed.	`1.31.0.233, 1.40.0.244`
Confirmation before critical actions R1 00:00, 16:24 · R2 15:15	"Are you sure?" before placing orders, logging out, inventory changes, Wi-Fi and network settings, deliveries, codes, blocking, accounts and settings — every form that changes data.	`1.28.0 – 1.43.1.250`
Lock sign-in after 3 tries; block wrong Wi-Fi codes after 3	Sign-in locks after 3 wrong passwords (live countdown). A device that types 3 wrong Wi-Fi codes waits 5 minutes.	`1.29.0.218, .220`
Wastage limited to one opened package R1 06:47	Each entry is capped at what one package holds and at the stock; "Spoiled (napanis)" added as a reason.	`1.29.0.221`
Archive accounts instead of deleting	"Archive" with Restore; no account is ever deleted (self-delete removed); archived accounts get no alerts.	`1.29.0.222–226`
Backups more often than nightly R1 45:58	Every hour while the server is on; last 7 days kept.	`1.29.0.224`
Activity Log by category and date R2 31:50	Filter by kind (Sign-ins, Accounts, Backups, System) and date range; stock changes are in Stock History.	`1.38.0.242`
AI pending-actions icon confused with the chatbot	Robot-with-cog icon, labelled "AI actions waiting for approval".	`1.29.0.223`

2. Kept by design

Request	Decision
One shareable Wi-Fi code for a group R1 13:09	Kept **one code per device**: each phone has its own clock and can be traced or disconnected alone, and the captive portal stays stable. Instead the cashier chooses **how many codes per order** (paid codes by quantity; 1–10 free codes when the order qualifies), the order confirmation lists them, and over 20 codes or bad quantities are refused with a clear message (v1.43.0.249).
Voids approved on the spot R1 25:10	Kept the owner-approval queue: one staff member per shift, and the owner approves from their phone. Refunds use the same queue.

3. Owner's requests — done

Request	What changed	Version
AI manages the Wi-Fi by default	Barista AI sets plan speeds itself (automatic speed on; plans lowered to fit the measured line) and blocks newly seen adult sites at once — each with a notification and an off switch. Device blocks, disconnects and codes still need approval.	`1.32.0.235`

Request	What changed	Version
See the AI balance and daily limit	AI Usage card: OpenRouter balance and today's free requests.	`1.29.0.223`
Orders by day / week / month / year, with export	"Show" choice on Orders, count for the period, **Export CSV** of what's listed.	`1.42.0.248`
Supplier dropdown	Pick a saved supplier on both delivery forms; "Someone else…" for new ones.	`1.41.0.246`
Cleaner register toolbar	One row: search, icon buttons (Orders, Cash, X-Read), End Shift. Menu cards size to the space.	`1.41.1.247`
Non-VAT shop	Cart and receipt say VAT-exempt; placeholder address and TIN removed.	`1.40.1.245`

> **Action for the owner:** top up OpenRouter before the defense — the balance was −$0.20, which limits the AI to 50 requests a day.

4. Safety fixes found in code review

- Archived accounts still received shortage, stock and network emails — now only active accounts.
- Any device could fake its address to dodge the wrong-code and sign-in limits — only the shop's proxy is trusted.
- Restoring the oldest backup deleted it first — the backup being restored is never pruned.
- The AI Usage card ignored a saved key and stalled offline — fixed.
- The Sales page counted voided orders in its totals — fixed.
- Profile allowed staff to delete their own account — removed.

5. Answered during the evaluation

- **Server security on guest Wi-Fi:** firewall rules give guests internet only; SSH and admin pages of the server, firewall and DNS are blocked for them.
- **HTTPS, offline use, AI token limits, scheduled jobs, BIR receipts, Senior/PWD discounts, reprinting:** already in place.
